

Precision manufacturer lifts on-time delivery to 96%

A three-plant discrete manufacturer serving automotive and aerospace OEMs

88% → 96%

on-time delivery in two quarters

18%

less unplanned downtime

10 weeks

to all three plants live

The challenge

Production data lived in the MES, the ERP, and a nightly spreadsheet. Plant managers saw scrap and downtime the next morning, and two OEM customers had opened corrective action requests over late deliveries.

The approach

- Native connectors to the plants' MES and ERP, live in the first three weeks
- Shift-level OEE, scrap, and downtime views for every line
- Alerts to line supervisors when scrap or downtime crossed agreed thresholds during the shift
- A weekly OTD scorecard shared directly with OEM customer quality teams

The results

Metric	Before	After two quarters
On-time delivery	88%	96%
Unplanned downtime	7.9%	6.5%
OEE	62%	68%
OEM corrective actions open	2	0

“The first week we had shift-level scrap alerts, a supervisor caught a tooling issue at 10 a.m. that used to cost us a full shift of parts.”

Plant Manager
